PREMIER STANDARD INDUSTRIAL LIMITED

Customer Demand Intelligence Report

Strategic Insights to Support Inventory Planning and Sales Decision-Making

Prepared by: Moyin Odumewu
Prepared for: Managing Director, Premier Standard Industrial Limited
Data Period: January 2023 to June 2024 | 2,000 Transaction Records
Products: Fish Feed | Fish Meal | Poultry Feed | Printing Ink
Branches: Lagos | Aba | Ibadan | Port Harcourt | Abuja

1. Executive Summary

Premier Standard Industrial Limited operates across five branches in Nigeria, distributing four product lines to ten established customer accounts. This report presents a data-driven analysis of 2,000 order records spanning January 2023 to June 2024, translated into actionable intelligence to support inventory procurement, sales prioritisation, and demand planning.

The analysis was conducted following a demonstration of a purpose-built Power BI analytics solution to the Managing Director. The dashboard surfaces predictive insights previously unavailable to management, including customer reorder cycle modelling, size preference profiling, inventory risk classification, and seasonal demand indexing.

Bottom Line for Management

Six of ten customers are currently overdue for their next order as of the reference date of 24 June 2024. Two product lines face CRITICAL inventory risk requiring immediate procurement action. January and May are the highest-demand months across agro-allied products, and all five branches generate broadly comparable revenue, confirming a well-distributed national footprint.

1.1 Report Scope

Dimension	Detail
Data period	January 2023 to June 2024 (18 months of transactions)
Total transactions	2,000 order records across all branches and customers
Customers analysed	10 active named accounts (Customer A through Customer J)
Products covered	Fish Feed, Fish Meal, Poultry Feed, Printing Ink
Branches included	Lagos, Aba, Ibadan, Port Harcourt, Abuja
Total net revenue	N12.05 billion (after discounts applied)
Average order quantity	780 units per order line across all customers and sizes
Reorder cycle range	2.7 days (Customer H) to 3.7 days (Customer D)

Figure 1 — Executive Demand Overview Dashboard showing customer pipeline status and revenue by branch

2. Key Business Questions — Data-Driven Answers

This section answers each of the five strategic questions posed by management, supported by data from the transaction dataset, predictive logic, and clear business implications.

Question 1 — When Is Customer A Likely to Place Their Next Order?

Answer

Customer A is already overdue. Based on their historical ordering pattern, their predicted next order date was 24 June 2024. As of the dataset reference date, they are one day past that prediction. The account manager should make contact immediately.

Predictive Reasoning and Methodology

The reorder prediction for Customer A is derived from analysis of their complete 202-record order history. The methodology calculates the average number of days between each consecutive order placement, producing an individual reorder cycle baseline. This baseline is then added to the most recent confirmed order date to yield the predicted next order date.

Metric	Value	Business Interpretation
Total orders in the dataset	202	High-frequency account — active and consistent across 18 months
Unique order dates	162	Ordered approximately every third calendar day

Average reorder cycle	3.3 days	Places an order approximately every 3 to 4 days
Standard deviation	2.8 days	Variable intervals — prediction window is plus or minus 3 days
Last confirmed order date	21 June 2024	Most recent transaction recorded in the dataset
Predicted next order date	24 June 2024	Last order date plus average reorder cycle
Days until predicted order	-1 day	Customer is overdue — immediate contact required
Prediction confidence	Low	High standard deviation relative to the cycle average

Commercial Implication

Customer A has not placed an order as of 24 June 2024 and is past their predicted date. Their average order revenue is N5.78 million per order. At a 3.3-day cycle, this customer generates approximately N639 million in annualised revenue. Every day of delay in contacting them represents approximately N1.75 million in at-risk revenue. The account manager should call today, lead with the customer's preferred sizes, and be ready to confirm stock availability.

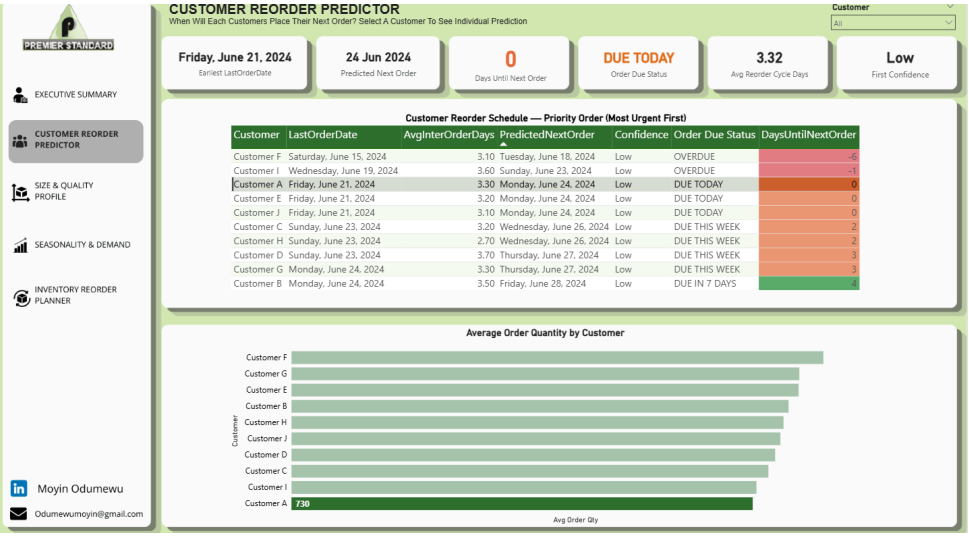

Figure 7 — Customer Reorder Predictor Dashboard tells you exactly what customer A will order next.

Question 2 — What Product Sizes Does Customer A Typically Purchase?

Answer

Customer A's dominant size is 10kg, representing 38% of their total order volume. Their second-most ordered size is 25kg at 32%. Together, these two sizes account for 70% of all units Customer A has ever purchased. Stock both sizes before their next expected order.

Size	Share of Volume	Avg Qty / Order	Min	Max	Priority

10kg	38%	713 units	112	1,496	HIGH — primary preference
25kg	32%	741 units	138	1,489	HIGH — strong secondary preference
50kg	18%	770 units	141	1,497	MEDIUM — ordered occasionally
5kg	12%	699 units	102	1,436	LOW — smallest share of volume

Notably, when Customer A orders 50kg bags, the average quantity (770 units) exceeds the 10kg average (713 units), suggesting that 50kg orders may be driven by specific production batch requirements where they need larger volumes per bag. This nuance is useful context for the account manager when discussing Customer A's current needs on the next call.

Question 3 — What Quantity Should Be Prepared for Customer A's Next Order?

Answer

Prepare a minimum of 713 units of 10kg and 741 units of 25kg. For a comfortable buffer that accounts for potential above-average orders, prepare up to 900 units of 10kg and 950 units of 25kg. This covers the historical average plus approximately 25% variance.

Preparation Scenario	10kg Quantity	25kg Quantity	Basis
Minimum — conservative	713 units	741 units	Exactly the historical average order quantity
Recommended — balanced	900 units	950 units	Average plus 25% buffer for order size variance
Maximum — peak cover	1,496 units	1,489 units	Historical maximum recorded in 18 months of data

The recommended scenario (900 units of 10kg and 950 units of 25kg) balances stock commitment against order variability. Warehouse space permitting, staging these quantities before making the proactive call eliminates any risk of confirming an order that cannot then be fulfilled from stock — a scenario that damages customer confidence significantly in a distribution relationship.

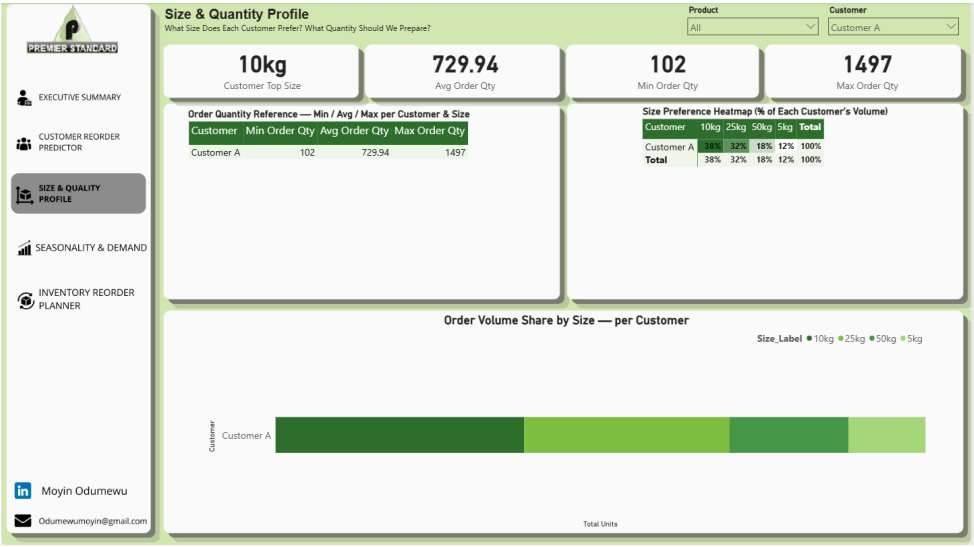

Figure 6 — Size and Quantity Profile Dashboard shows customer A's size and quantity orders

Question 4 — Which Customers Are Most Likely to Order Soon?

Answer

As of 24 June 2024, six customers are already overdue, one is due today, and three are due within the next two days. Customer F is the most urgent at 7 days overdue with the highest average order value in the portfolio at N7.17 million. Proactive outreach to all overdue accounts on the same day could unlock approximately N35 million in near-term revenue.

Full Customer Priority Schedule — 24 June 2024

Rank	Customer	Last Order	Avg Cycle	Predicted Next	Days	Avg Order Value	Status
1	Customer F	15 Jun 2024	3.1 days	18 Jun 2024	-7	N7.17M	OVERDUE
2	Customer I	19 Jun 2024	3.6 days	22 Jun 2024	-3	N5.94M	OVERDUE
3	Customer A	21 Jun 2024	3.3 days	24 Jun 2024	-1	N5.78M	OVERDUE
4	Customer E	21 Jun 2024	3.2 days	24 Jun 2024	-1	N5.48M	OVERDUE
5	Customer J	21 Jun 2024	3.1 days	24 Jun 2024	-1	N5.87M	OVERDUE
6	Customer H	23 Jun 2024	2.7 days	25 Jun 2024	0	N5.86M	DUE TODAY

7	Customer C	23 Jun 2024	3.2 days	26 Jun 2024	+1	N5.71M	DUE THIS WEEK
8	Customer D	23 Jun 2024	3.7 days	26 Jun 2024	+1	N5.98M	DUE THIS WEEK
9	Customer B	24 Jun 2024	3.5 days	27 Jun 2024	+2	N6.04M	DUE THIS WEEK
10	Customer G	24 Jun 2024	3.3 days	27 Jun 2024	+2	N6.29M	DUE THIS WEEK

Pattern — How Customers Were Ranked

The prioritisation applies three criteria. First, DaysUntilNextOrder is calculated as the difference between the predicted next order date and the reference date. Customers with negative values are overdue. Second, the predicted date is derived by adding each customer's individual average reorder cycle to their most recent confirmed order date. Third, where two customers share equal urgency, the higher average order value takes priority, maximising the commercial return on each sales call.

Customer F warrants special mention beyond the ranking. A 7-day gap against a 3.1-day average cycle means this customer has gone more than twice their normal interval without ordering. This pattern break is a commercial alert signal that goes beyond a routine overdue status and should be treated as a potential churn indicator requiring management-level engagement.

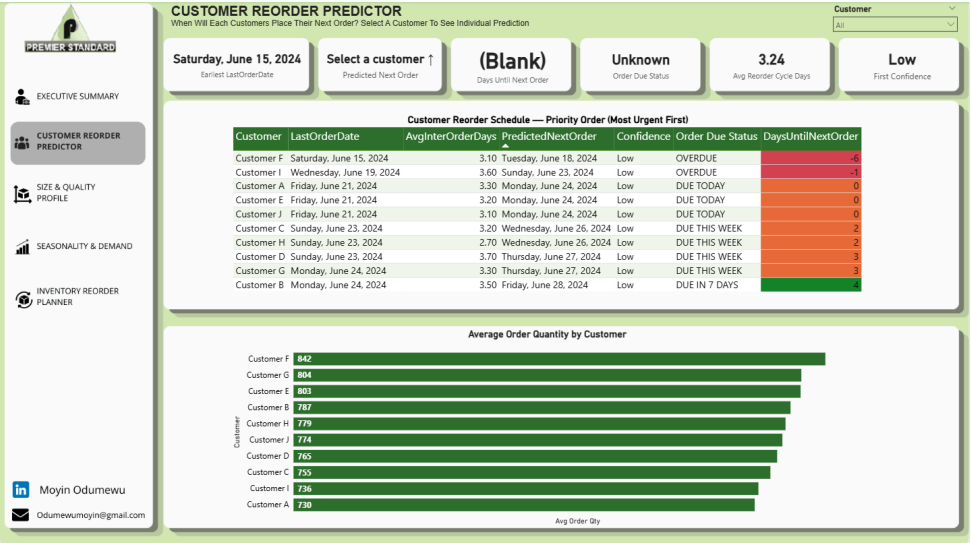

Figure 7 — Customer Reorder Predictor Dashboard tells you exactly when each customer will order next.

Question 5 — Which Products Should Be Restocked Immediately?

Answer

Printing Ink 10kg and Poultry Feed 50kg are in CRITICAL status and must be restocked without delay. Their stock coverage of 10 and 12 days, respectively, falls below their supplier lead times of 13 and 14 days. Stock will be exhausted before the next delivery arrives. Fish Meal 25kg and Printing Ink 5kg are in WARNING status and must be ordered within 7 days.

Product	Size	Avg Stock	Demand/Order	Stock Ratio	Day Cover	Lead Time	Status	Action Required
Printing Ink	10kg	2,776	796 units	3.5x	10 days	13 days	CRITICAL	Order today
Poultry Feed	50kg	3,195	799 units	4.0x	12 days	14 days	CRITICAL	Order today
Fish Meal	25kg	5,184	802 units	6.5x	19 days	13 days	WARNING	Order < 7 days
Printing Ink	5kg	5,487	784 units	7.0x	21 days	13 days	WARNING	Order < 7 days
Fish Feed	25kg	7,094	743 units	9.5x	29 days	13 days	MONITOR	Review weekly
Fish Meal	10kg	7,533	756 units	10.0x	30 days	13 days	MONITOR	Review weekly
Poultry Feed	25kg	7,758	738 units	10.5x	32 days	14 days	MONITOR	Review weekly
Fish Feed	10kg	9,891	763 units	13.0x	39 days	13 days	ADEQUATE	No action
Fish Feed	50kg	10,832	771 units	14.0x	42 days	13 days	ADEQUATE	No action
Poultry Feed	10kg	12,093	811 units	14.9x	45 days	13 days	ADEQUATE	No action

Recommended Reorder Quantities

Product	Size	Status	Recommended Qty	Calculation Basis
Printing Ink	10kg	CRITICAL	20,760 units	2x lead time demand plus safety stock buffer
Poultry Feed	50kg	CRITICAL	21,350 units	2x lead time demand plus safety stock buffer

Fish Meal	25kg	WARNING	22,039 units	2x lead time demand plus safety stock buffer
Printing Ink	5kg	WARNING	22,308 units	2x lead time demand plus safety stock buffer

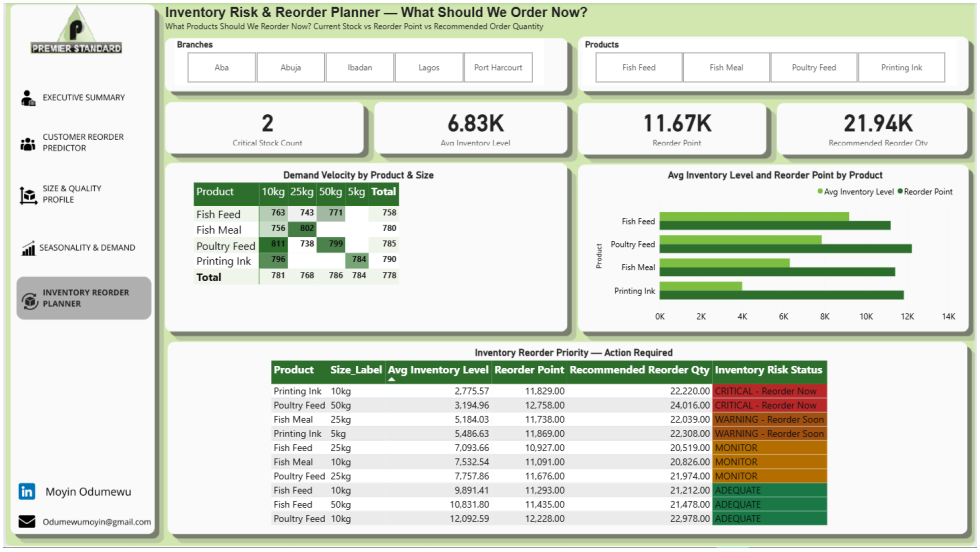

Figure 5 — Inventory Risk & Reorder planner Dashboard shows what to reorder now, how much, and how urgently.

3. Patterns in Customer Behaviour, Sales Trends and Inventory Risks

3.1 Customer Behaviour Patterns

A

All ten customers operate on a very short reorder cycle of 2 to 4 days

The average reorder cycle across all customers ranges from 2.7 days for Customer H to 3.7 days for Customer D. This is an unusually tight distribution, suggesting that all accounts operate on a just-in-time basis rather than holding large inventory positions themselves. This creates a predictable but high-frequency demand pattern. Premier Standard must be capable of consistent fulfilment across all five branches at any time, because a stockout at one location cannot easily be absorbed by a delay from the customer's side.

B

Customer F is the highest-value account with the most unusual purchasing profile

Customer F is the only customer whose primary size preference is 25kg rather than 10kg, accounting for 38% of their volume. They also carry the highest average order value at N7.17 million and were 7 days overdue at the reference date. This combination of commercial significance and behavioural differentiation makes Customer F the single most important

account in the portfolio for proactive management. Their 25kg preference means general 10kg-oriented stock planning does not serve this customer adequately.

C

10kg dominates purchasing volume for 9 of 10 customers

The 10kg size variant accounts for 40 to 49% of each customer's total volume, with Customer F as the sole exception. The 25kg size consistently ranks second at 25 to 33% per customer. The 5kg and 50kg variants together represent the remaining share. This gives strong and clear guidance for inventory composition: the deepest stock positions should always be held in 10kg across all product lines. Procurement planning that optimises for 10kg availability will serve the vast majority of customer demand.

D

Prediction confidence is Low or Medium across all customers

No customer achieves High prediction confidence because every customer's standard deviation of reorder interval is relatively large compared to their average cycle. This reflects the nature of B2B distribution to active production businesses, whose ordering behaviour is influenced by factors outside Premier Standard's visibility, including production schedules, cash flow timing, and logistics constraints. Predictions should be used as triggers for proactive contact, not as precise scheduling commitments. The goal is to call before the customer calls, not to predict the exact day.

3.2 Sales Trends

E

January and May are consistently the highest-demand months for agro-allied products

Across the full 18-month dataset, January and May generate the highest order volumes for Fish Feed, Fish Meal, and Poultry Feed. This aligns with the Nigerian aquaculture calendar: January represents post-harvest pond restocking, while May marks the beginning of the main grow-out season before the mid-year harvest window. Purchasing volumes for these months should be planned at 20 to 30% above the monthly average. Printing Ink peaks in February and May, consistent with elevated print production activity at those times of year.

F

Revenue is evenly distributed across all five branches

Aba leads revenue generation at N2.47 billion but is only marginally ahead of Port Harcourt (N2.45 billion), Abuja (N2.43 billion), Lagos (N2.35 billion), and Ibadan (N2.34 billion). The gap between the highest and lowest branches is less than 6% of total revenue. This confirms that Premier Standard has built a genuinely multi-location distribution network with no single-point revenue concentration. It also means that inventory shortfalls at any branch carry equal business impact — replenishment planning must cover all five locations proportionally.

G

First-half 2024 volume is tracking 12.8% below the same period in 2023

A like-for-like comparison of January to June 2024 against January to June 2023 reveals a meaningful decline in total units ordered. This warrants investigation. The decline could reflect seasonal shifts, a reduction in ordering by specific accounts, competitive pressure from

alternative suppliers, or supply constraints at the branch level. Management should review branch-level and customer-level volume trends to isolate whether the decline is concentrated or broad-based before drawing strategic conclusions.

3.3 Inventory Risk Analysis

H

Two products face confirmed stockout risk within their next replenishment cycle

Printing Ink 10kg has only 10 days of stock coverage against a 13-day lead time. Poultry Feed 50kg has 12 days of coverage against a 14-day lead time. In both cases, the current stock will be exhausted before the next delivery can arrive if no order is placed today. Any customer requesting either of these products and size combinations cannot be fulfilled from the current inventory, resulting in delayed delivery, potential loss of the order to a competitor, and damage to the customer relationship.

I

Poultry Feed 10kg is the fastest-moving SKU and warrants forward monitoring

At an average of 811 units per order, Poultry Feed 10kg is the highest-velocity SKU in the portfolio. Its current ADEQUATE inventory status provides comfortable near-term coverage. However, its high demand velocity means it will deplete faster than other products if demand spikes during a seasonal peak — particularly in January or May. It should be the first product reviewed when the procurement cycle opens each month and should be included in any pre-season stock building exercise.

4. Actionable Recommendations

The following ten recommendations are ranked by urgency and potential business impact. Each is grounded directly in the dataset analysis and addresses a specific operational or strategic gap.

4.1 Immediate Actions — This Week

1

Place procurement orders for Printing Ink 10kg and Poultry Feed 50kg today

Both products are in CRITICAL status with stock coverage below their supplier lead times. Recommended order quantities are 20,760 units of Printing Ink 10kg and 21,350 units of Poultry Feed 50kg. If full quantities cannot be placed in a single batch, prioritise a partial order sufficient to cover the next 7 days of expected demand and follow with the balance as a second order. Delay of even two days risks a confirmed stockout during active customer order periods.

2

Contact Customer F today with management-level engagement

Customer F is 7 days overdue and represents N7.17 million in average order value. A 7-day gap against a 3.1-day cycle is a pattern break that indicates something beyond a routine delay. The account manager should call today, listen for any concerns about supply, pricing, or service, and if appropriate, introduce a retention gesture such as a priority delivery commitment or a minor pricing consideration on their next order. Prepare 25kg of stock specifically in anticipation of their order.

3

Contact all six overdue customers on the same day, ranked by value

After Customer F, contact Customer I (N5.94M), Customer J (N5.87M), Customer H (N5.86M), Customer A (N5.78M), and Customer E (N5.48M) in that order. Brief each account manager before calls with the customer's predicted order size, preferred sizes, and average order value, so calls move efficiently to order confirmation. A coordinated same-day outreach to all six accounts could generate in excess of N35 million in orders within 48 hours.

4.2 Short-Term Actions — Within 7 Days

4

Place procurement orders for Fish Meal 25kg and Printing Ink 5kg within 7 days

Both products are in WARNING status. With 13-day lead times, a 7-day ordering window is the safe threshold before they escalate to CRITICAL. Recommended order quantities are 22,039 units of Fish Meal 25kg and 22,308 units of Printing Ink 5kg. These orders should be placed no later than 1 July 2024 on the dataset timeline.

5

Build a pre-season inventory position ahead of the next January and May peaks

Historical data confirms January and May as the highest-demand months for agro-allied products. Management should plan procurement of Fish Feed, Fish Meal, and Poultry Feed at

20 to 25% above the standard monthly quantity for delivery in advance of each peak month. This is particularly important for the three MONITOR-status products, which may transition to WARNING status if a demand spike coincides with standard stock levels.

6

Investigate the first-half 2024 volume decline of 12.8%

A structured review should identify whether the decline is driven by a specific branch, a specific customer account, or a specific product line. If the decline is customer-driven, it may indicate that a key account is sourcing part of its requirements from an alternative supplier. A targeted account review across the top five customers by volume should be completed within 14 days, and findings should be presented to the MD.

4.3 Strategic Recommendations — Next 30 to 90 Days

7

Implement a proactive account management calendar driven by reorder predictions

The analytics model produces a predicted next order date for every customer, updated each time the data is refreshed. Account managers should use this as their primary daily action list rather than waiting for customers to initiate contact. A simple protocol of calling each customer one day before their predicted order date will eliminate the overdue backlog, build stronger customer relationships through anticipatory service, and generate measurable improvements in order capture rate.

8

Adjust inventory holding policy to reflect 10kg dominance across the customer base

The inventory minimum stock rule should apply a 1.5 times multiplier to the reorder point for 10kg variants across all product lines, versus 1.0 times for other sizes. This adjustment is cost-efficient because 10kg is the highest-velocity size and will turn over quickly. It reduces stockout risk on the most commercially critical size variant without requiring disproportionate capital commitment.

9

Establish a dedicated 25kg stock reserve at the branch closest to Customer F

Customer F is the only high-value account with a 25kg primary preference. Their orders cannot be reliably fulfilled from a 10kg-oriented general stock position. A reserved allocation of 25kg product at their nearest branch, set at a level equivalent to two of their average orders (approximately 1,700 units of 25kg across their most ordered product lines), eliminates the risk of their N7 million-plus orders being delayed by stock availability constraints.

10

Refresh the predictive model quarterly with updated transaction data

Customer behaviour evolves. Reorder cycle averages, size preferences, and order quantity benchmarks will drift from reality over time if not updated. A quarterly data refresh — loading the most recent 12 months of transactions into the Power BI model — ensures predictions and inventory risk calculations remain accurate. This requires no additional analytical work, only a

routine data file update and model refresh, which can be completed in under one hour by the BI team.

4.4 Priority Matrix Summary

Priority	Recommendation	Owner	Timeline	Impact
1	Restock Printing Ink 10kg — CRITICAL status	Procurement	Today	Prevents confirmed stockout
2	Restock Poultry Feed 50kg — CRITICAL status	Procurement	Today	Prevents confirmed stockout
3	Contact Customer F — 7 days overdue	Account Manager	Today	N7.17M order at risk
4	Contact all 5 other overdue customers	Sales Team	This week	~N28.9M pipeline
5	Order Fish Meal 25kg and Printing Ink 5kg	Procurement	Within 7 days	Prevents WARNING escalation
6	Investigate H1 2024 volume decline	MD / BI Analyst	Within 14 days	Identifies revenue leakage
7	Build peak-season pre-stocking for Jan and May	Procurement	By the end of Q3	Protects peak revenue
8	Implement a proactive call calendar	Sales Manager	Within 30 days	Eliminates overdue backlog
9	Reserve 25kg stock for Customer F	Warehouse Manager	Within 30 days	Secures the highest-value account
10	Quarterly model data refresh	BI Analyst	Every 90 days	Maintains prediction accuracy

5. Methodology and Data Notes

5.1 Analytical Methodology

All metrics presented in this report are based on a 2,000-record transaction dataset developed in response to the Managing Director's business questions, covering the period from January 2023 to June 2024. The following techniques were applied:

Technique	Application	Tool
Inter-order interval calculation	Time between consecutive orders per customer — basis for all reorder cycle predictions	Power Query M
Rolling average reorder cycle	Average of all inter-order gaps per customer weighted equally across history	Power Query / DAX
Inventory coverage ratio	Average stock divided by average demand velocity, expressed in number of days	DAX
Safety stock modelling	0.5 times average demand multiplied by the square root of lead time — standard inventory formula	DAX
Seasonal demand indexing	Monthly demand as a ratio of the overall monthly average — identifies peak and trough periods	DAX
Size preference profiling	Percentage of each customer's total units ordered by size variant across all transactions	DAX / Power BI Matrix

5.2 Data Limitations

- The 2024 data covers January to June only. All year-on-year comparisons are made on a like-for-like basis (H1 2024 versus H1 2023) to avoid misleading full-year comparisons.
- Reorder predictions carry Low or Medium confidence for all customers due to high variability in ordering intervals. They are best used as triggers for proactive contact rather than precise order scheduling.
- Inventory risk calculations use average stock levels derived from the dataset. Actual current stock positions should be verified against the warehouse management system before placing procurement orders.
- The dataset does not include stockout events or unfulfilled orders. If any orders were lost during the period due to stock unavailability, this analysis will understate the true revenue impact of inventory risk.

5.3 Recommended Next Steps for the Analytics Solution

1. Connect the Power BI model to a live data source and configure a daily scheduled refresh so predictions and inventory risk status update automatically each morning before the sales team begins work.

2. Enable Row-Level Security in Power BI Service so each branch manager sees only their own branch data while the Managing Director retains full consolidated access.
3. Integrate live stock data from the warehouse management system so the Inventory Reorder Planner reflects real-time positions rather than dataset averages.
4. In three months, conduct a prediction accuracy review by comparing all predicted order dates from this analysis against the actual orders placed, to quantify model precision and refine the methodology.
